

Starter Class Diagram

The *Starter Class Diagram* pattern creates elements and a Class diagram that describes how two Classes are related to each other. The associations show semantic or structural relationships between the classes.

Figure 1. Shows a Class diagram with two classes connected by an Association relationships. The Association is named and an indicator shows how to read the relationship between the two classes.

Discussion

The purpose is to allow a Analysts and other stakeholders to be able to create and view elements that represent important 'things' in the domain of interest and the structural or semantic way they are related. The relationships are added to show how the elements relate to each other and can be adorned with multiplicities (cardinalities) and role names to describe these relationships in more detail.

It is typically used early in an initiative to describe the important elements in a domain. The pattern is useful for analysis but are also a fundamental tool for sharing knowledge and ensuring that all stakeholders share a common understanding of the important 'things' in the domain being discussed and how they are related.

The following is a list of some things you may want to do when working with this pattern.

- Change the name of the Package and the diagram to suit the initiative.

- Change the name of the Classes to suit the initiative.
- Change the names of the roles and the cardinalities described by the multiplicities.
- Create additional Classes to expand the hierarchy down to another level.

The following is a list of some of the next steps available when applying the pattern.

- Add descriptions to the Classes to describe their role in the system description.
- Add one or more State machines to describe the discreet states a particular Class could exhibit.
- Add Operations to the Classes if needed.
- Automatically generate documentation with the Document Generator using built-in or user-defined templates.

Reference

The following help topics will assist you learn about how to work with this pattern.

[Class Diagrams](#)

[Class Diagram and Toolboxes](#)

[Associations](#)

[Working with Diagrams](#)

[Changing Element Appearance](#)

[Changing Diagram Layout](#)

The following are some of the tools that will be helpful when working with this pattern.

[Specification View](#)

The Specification View can be used as a way of working with the Components and Interfaces particularly when there are a large number of elements as is typically the case when describing a system of any appreciable size. For more details see the [Specification View](#) help topic

[Diagram Layout](#)

The Diagram Layout tool allows you to layout an entire diagram, selected elements or sections of a diagram to make it more visually appealing or meaningful to a particular audience. There are a wide range of layout types to choose from and some types have filters that can be applied. For more details see the [Diagram Layout](#) help topic.

Pan and Zoom

The Pan and Zoom facility is one of the tools that can be used to navigate around a large diagram. Often the resolution of a diagram must be reduced to ensure it is wholly visible but by using the Pan and Zoom window you can leave the diagram at a readable resolution and pan around to areas of interest zooming in when necessary. For more details see the [Pan and Zoom](#) help topic.

Diagram Legends

The Diagram Legend facility is useful for manually or automatically changing the appearance of elements and connectors on a diagram. A legend can be added from the Common Toolbox and configured to codify the fill and line color and line thickness. This is a powerful way to add meaning and expression to a diagram and is particularly expressive when applied automatically based on element or connector properties. It can be used with a number of specialized diagrams such as roadmaps to create a powerful visualization. For more details see the [Diagram Legends](#) help topic.

Relationship Matrix

The Relationship Matrix provides a spreadsheet like view of two groups of elements and the relationships that exist between them. It can be used as a powerful analysis mechanism to visually indicate how elements are related to each other and to discover which elements are missing relationships. For more details see the [Relationship Matrix](#) help topic.

Traceability Window

The Traceability Window automatically displays the relationships that exist between Use Cases and other model elements including up-process and down-process elements. The traceability tree view can be conveniently expanded to see deeper relationships and elements displayed in the window can be located in all diagrams in which they appear. For more details see the [Traceability Window](#) help topic.

Document Generator

The Document Generator is a powerful facility in Enterprise Architect that allows a Database Engineer or other stakeholder to create high quality corporate or technical documentation directly from the model, suitable for internal or external audiences. For

more details see the [Documentation](#) help topic or the more general topic on [Model Publishing](#).

[Element Discussions](#)

The Element Discussion facility is a fully featured collaboration tool allowing modelers and model viewers and reviewers to communicate with each other directly inside the repository. Modelers using the full client or occasional viewers using WebEA can both post and reply to discussions and communicate and engage in chat. For more details see the [Element Discussions](#) help topic.

[Hand Drawn and Whiteboard Diagrams](#)

The Hand Drawn and Whiteboard Mode are display options available for any diagram that changes a system-drawn diagram to appear as though it was drawn by hand and, optionally, hand drawn on a whiteboard. It is a powerful device to engage an audience by presenting the diagram in a rough and more immediate style giving the impression that it is just a sketch that can be changed. For more details see the [Hand Drawn and Whiteboard Mode](#) help topic.

[Alternate and Images for Diagram Elements](#)

Most standard elements allow an alternate image to be defined for an element that will be used in place of the graphical notation for the element either on a selected diagram or as a default on all diagrams. For more details see the [Using the Image Manager](#) help topic.
